# UD1. Activity 3

This year we are going to develop a website for the school's blue whale. To do so, in this activity we are going to create the first design of the website.

The client has specified the following requirements:

- On the homepage they want a 3D skeleton of a blue whale. The user must be able to interact with it. In this link you have a model used in The Natural History Museum in London.

- There has to be a page showing the history of the whale. This page will show historical images, such as the one you can see in the following link.

- The website should contain another page with a portfolio of the whale assembly. In this link you can see some of these pictures. The author of the photograph must appear on the website.

- There will be a news section, where users will be able to publish news related to the whale.

- The website will have another section in which the work done by the students at different times will be shown, which could be called 'Al voltant de la balena', in which there will be two subsections: one with technical data sheets of each bone, and another oner with other activities.

- For the creation of the technical data sheets and news we need users, so we need a login page. There will not be a registration option open to the public.

- In the future it is foreseen to integrate with the existing archive page: https://arxiumuseuiesjoanramis.web.app/inici

To make this first design we are going to make a wireframe for each of the pages we need (except for the 'Other activities' page), so first we have to analyse how many pages we need for this website, although it is quite clear.

Remember that any design must always be responsive, so we will draw a wireframe for the DESKTOP version and another one for the MOBILE version for each page.
